A:Note: expression of opacity proteins is regulated by the number of translated repeat elements CTCTT, which code for part of the signal sequence; the protein can only be synthesized when the number of repeats place the start codon in frame with the rest of the protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A;Gene: rIL-3Rbeta

A; Note: there is no known gene that maps in this region. As this region is not overlapped by any other genes and it contains a large open reading frame, the authors suggest that it represents a previously unidentified gene, which they named git; the propose that, in conjunction with the EalO protein, the git gene product is involved in production of the Tro phenotype
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               qqbpg1; TOIG o1: qq

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Boeltner D., MacMahon C., Pembroke J.T., Strike P., Osbo
RR391 is an 89 kb conjugative genomic island comprising
related to plasmids, phages, and transposable elements.
Submitted (MAR-2002) to the EMBL/GenBank/DDBJ databases.
